Automating employee loan management on the Salesforce platform

PURE TRUTH WATER FACTORY

Loan Management App — Executive Report

Automating employee loan management on the Salesforce platform

Context

Pure Truth Water Factory managed employee loans through a manual spreadsheet process. This process carried concrete risks to the business: there was no way to automatically validate the loan limit against each employee's salary, no control preventing an employee from holding more than one active loan at a time, bank receipts were lost or scattered, and Management found it difficult to obtain reports or calculate the total amount loaned at any given moment.

To address this, a native Salesforce application was developed, built with Flow Builder and Approval Processes on top of the Aetotech Loan App Mgr package, that digitizes and automates the entire loan lifecycle end to end: from employee onboarding, through loan request and approval, to the recording and approval of every payment made.

Three roles take part in the process: the Employee, who requests loans and records repayments; the Finance Officer, who onboards employees and approves or rejects each loan request and each payment; and the Administrator, who builds and maintains the system.

What the System Solves

The following details how the solution addresses each of the original business requirements:

Original Requirement	Previous Situation	Implemented Solution
#1 — Centralized app; calculation and reporting of loan issued, interest, balance, and total outstanding	All loan management was handled through a manual Excel spreadsheet, with no reliable calculations or traceability	A centralized system where every loan and every payment has a single record; the amount loaned, interest, balance, and outstanding total are calculated automatically for each employee
#2 — Simultaneous use by multiple users, to reduce Finance Department workload	Finance manually entered every request and every payment, creating bottlenecks and delays	Employees submit their own requests and their own payments remotely; Finance only intervenes to approve or reject
#3 — Store a digital copy of the bank receipt for each repayment	Paper receipts, lost or scattered, with no digital backup	Every payment requires a mandatory digital receipt attachment before it can be submitted for review — without a receipt, no payment is recorded

#4 — Weekly/monthly repayment reports, for online verification or against bank statements	There was no way to cross-check recorded payments against actual bank activity	Repayment reports and a visual dashboard, ready to cross-check against bank statements at any time — exportable to Excel or other formats, preserving the convenience of spreadsheet work when needed

Original Requirement	Previous Situation	Implemented Solution
#5 — Validate multiple loan applications and the loan limit	An employee could end up with more than one active loan, and there was no control over the limit based on salary	A second request is automatically blocked while a loan is in progress; each request is validated against the allowed limit before proceeding; once a loan is fully paid off, the system automatically enables the employee to request a new one, with no additional steps

Additional Improvements Delivered

Beyond the explicitly requested points, the build also delivered the following capabilities, adding further operational value and control:

Additional Improvement	Value It Adds
Financial dashboard	A visual dashboard consolidates the loan portfolio and repayment pipeline in a single view, giving Management and Finance an at-a-glance read of the overall financial situation without having to open detailed reports
Traceability of receipt-less attempts	A payment attempt submitted without a receipt is not lost or discarded: it is logged under its own status, visible for audit purposes, without reaching the approval queue — so the approver only reviews payments that are actually ready
Audit trail on rejections	A rejected payment is never edited or deleted: it remains as permanent evidence along with the rejection reason, while the employee corrects and submits a new payment
Automated report subscriptions	Reports can be automatically emailed on a recurring basis to the Finance Officer, with no need for anyone to manually retrieve them
Role-restricted access	Only the Administrator and the Loan Officer role can view consolidated portfolio-wide data; an employee cannot see the financial information of coworkers
Duplicate prevention at onboarding	When a new employee is onboarded, the system validates that no record already exists with the same employment number

Secure user identification	Every logged-in user is automatically linked to their own employee record, with no manual self-identification, preventing anyone from submitting a request or payment on another employee's behalf
Timestamped approval history	Both loan requests and payments carry a date, responsible party, and status, with no need for a separate audit system
Flexible payment types	Employees can settle their loan via monthly installment, full balance, or partial payment, with automatic amount calculation for the first two

Business Benefits

- **Reduced operational workload for Finance —** the team no longer manually enters requests or payments; it only reviews and approves, freeing up time for higher-value work.
- **Lower financial risk —** automatic validation of the loan limit and blocking of duplicate loans eliminate two of the main exposure points in the previous process.
- **Greater transparency and employee confidence —** every request and every payment receives an immediate response (approved, rejected, with a reason), with no waiting or ambiguity about the loan's status.
- **Full audit traceability —** every decision (approval, rejection, loan closure) is logged with a date and responsible party — something the Excel spreadsheet could not offer.
- **Up-to-date visibility for decision-making —** Management and Finance access reports and a dashboard that can be refreshed on demand, without waiting for month-end close to know how much capital is out or how much remains to be collected.
- **Continuity with existing work habits —** reports can be exported to Excel or other formats, allowing Finance to keep working with spreadsheets when needed, without losing any of the benefits of the centralized system.
- **Scalability —** built on Salesforce, the system can grow to more employees or additional benefit types without redesigning the process from scratch.

Next Steps

The system is already validated end to end. The following items have been identified as a natural evolution for a future phase:

- **Configurable interest rate —** manageable through a simple configuration, with no need to modify anything technical whenever it changes.
- **Cancellation of in-progress requests —** allow an employee to withdraw their own request while it is still pending review, giving them more autonomy over their own process.
- **Rollout to more employees —** the natural next phase is extending the design to the rest of the workforce.
- **AI assistants for routine tasks —** for example in employee onboarding or initial loan request intake (processes with clear, repeatable rules); payment approval would always remain with a person, the most sensitive control point against errors or fraud.
